

**NEW**

## **Hybrex – Access Control Phone**

# **ACP40/RFID**

The new Hybrex ACP40/RFID unit is now ready for release to compliment our other new ACP units. This new unit along with the ACP30D & ACP30D-RFID units now complete the new range of Door Phones & Access Control Phones.

The new look units are functional as well as appealing to the eye and will open up many new opportunities for Hybrex systems. The new ACP40/RFID unit is the replacement for the G1-ACP/RFID unit, but we still have some stock of the older unit available.

The new unit is suitable for many businesses such as hospitality, secured business premises, unattended reception areas and they can also be adapted for domestic use in residential homes.

Australia already has a number of apartment buildings and gated communities around the country currently utilising intercoms & access control solutions to manage their building access. The new Hybrex ACP range creates a great opportunity to speak to these existing building owners to offer a new solution or update for their existing one with the use of our new ACP units. In some situations you may be able to provide a Hybrex solution that can offer telephone, intercom & access control all in the one system and save them money.

Our range of ACP's are weather resistant and can be positioned outside in most under covered areas in such locations as building entries, car parks, front gates etc.

We envisage that the new ACP's will open up more opportunities for our dealers, if you can promote the capability of the Hybrex system using these devices to any of the venues in your area. It would also be advisable to promote this type of devices to any local Architects or Builders, who may require this type of solution for one of their clients.

The new ACP's will require a change in software to allow them to work with most Hybrex systems, you will need to check with our Technical Support team to allow them to advise you of the correct software required. Older systems may not support the card reader.

The ACP30/RFID and the ACP40/RFID units both use the new Mifare cards or FOBS, which are also available from us.

The functions available on the ACP40/RFID unit are as follows

- \*Built-In Mifare reader
- \* Keypad: Touch Sensitive dial pad
- \* Intercom for indoor use
- \*Door control
- \*Door status indication
- \*Self-Defence alarm
- \*Button illuminated by backlight lamp for night use
- \* 8 Level speaker volume
